- * 1 RSS-Reader iWidget with popup/setup menu
- * 115 brand-new icons (and still counting)
- * 5 different Iconomatic icon-designs
- * Statusbar and UI theming
- * New bootscreen and spinning wheels
- * Voice Sounds theme (English)
- * JellyLock
- * Zeppelin
- * Wallpapers
- * Dynamic Wallpapers
- * Original Yosemite Dock

NOTE: Some of this features are separate free Cydia packages, please search at Cydia for "X-CLASS" to find everything related to this theme.

Needed: iPhone 4, 4s, 5, 5c, 5s or Retina iPod with iOS 7.0 to 7.1.2
Iconomatic, Iconoclasm, iWidgets, LockHTML3, SBHTML (everything optional but recommended for the best experience)

Setup:

Winterboard: Enable the x-Class theme, one of the five X-Class iconomatic themes and the Sound.theme (make sure you have the standard sounds for Mail and SMS activated).

Iconomatic: Just make sure you have Winterboard theming for the icons activated

Iconoclasm: Enable the X-class layout at iconoclasm

Dock: Install the free tweak

ClassicDock from Cydia and choose the "Modern" (3D) dock

Statusbar Install and enable the free tweak **BlurBar** from Cydia

Wallpaper: Enable one of x-Class Wallpapers from the iOS Settings app or use your own wallpapers

Dynamic Wallpapers: Enable the Dynamic Wallpapers theme at

Winterboard and choose from Settings

Black Folders: for themed and dark folders install DarkFolders7 from Cydia

Circular folders: install "FolderIconRadius" from cydia, use a radius of 29.

JellyLock: enable the X-Class JellyLock theme at Winterboard

Zeppelin: enable the new x-class logo from Settings/Zeppelin

X-Class Widgets:

*Enable the X-Class widget or animated Widget (= animated portrait photo) or one of the separate widgets with iWidget or from LockHTML or SBHTML.

Whats the difference ?:

- iWidgets are only visible on one page and scroll with the icons
- SBHTML widgets are visible on every page and stay solid in the background
- LockHTML is needed for Lockscreen widgets

*Widgets fully support 8 languages (**English, German, French, Dutch, Turkish, Danish, Italian, Spanish**), GPS (needs WidgetWeather from Cydia), 12/24h clock, Celsius/Fahrenheit and different refresh intervals.*iWidgets and LockHTML widgets support a setup menu, for **SBHTML** make your setup manually at User/Library/SBHTML/X-Class SBHTML.../**Config.js**.

LockHTML and SBHTML also have a build-in dark wallpaper overlay, you can enable it at the settings of each widget.

***Replace the build-in photo/avatar** with any other photo, no photoshop is needed, it will be rounded with a transparent fading by my code. Best is a iphone portrait photo with a aspect ratio of around 1:1.5. Name your picture "You.png" (even if it's a jpeg-photo) and copy it to the "Images" folder of each widget you use: *User/Library/iWidgets/... User/Library/LockHTML/... User/Library/SBHTML/...*

X-Class RSS-reader:*Enable the RSS-Reader with iWidgets. It includes 8 predefined sources (7 english and 1 german feed), simply choosable from the iWidget popup menu*You can override rss sources at User/Library/iWidgets/X-Class iWidget RSS/

Options.plist with your own favorite rss feed.*NOTE: Not all feeds provide photos and the layout may differ depending on the rss feed.**FAQ and Help:**Folders: If you use one of the round iconomatic styles and want round folders then install the free Cydia tweak iFolderIconRadius and use a radius of around 29.

Animated Weather widgets:

Enable from iWidgets, LockHTML or SBHTML. These widgets base on

UniAW, so credits to Ian Nicol and Dacal, but with my own X-Class layout, own weather icons (HTC retro icon set is also included) and so on. All have a own setup menu. The SBHTML version has the largest menu, for the iWidget and LockHTML version you can make this further setup at the config.js file. BUT: Not all features of UniAW (like weather wallpapers, further info like sunrise time etc.) are supported or tested. Only what's needed for X-CLASS is included and tested. If you're not satisfied with that just tinker your own version of UniAW ;)
