2 Weather-Only Widgets, dark and light

Widgets supporting the following languages: English, German, French, Spanish, Turkish, Danish, Italian.

The UniAWmini widgets also supporting Russian, Chinese, Dutch and Finnish, but not Danish.

Twitter and all other widgets work worldwide.

FAQ and HELP:

*Do this widgets support **GPS**-located Weather ?

Yes, enable GPS at the widget menu. But you must have installed and enabled the free tweak '**Widget Weather**' from Cydia.

At the Settings App>WidgetWeather also make sure you've enabled „MyLocation“. The yahoo location code is irrelevant for the widgets now.

* How can I find my **yahoo Location/City code** for the weather widgets ?

Open this website: www.weather.yahoo.com, at the search field type in your city and look at the adressbar of your browser now, the 6 or 7 digits number at the end is your Yahoo location/city code.

DON'T USE ZIP Codes or anything ELSE !

*How can I setup the **Twitter** widget to own list ?

Please read my detailed and pictured PDF-Instructions [here](#)

*How can I move or **delete this iWidgets** ?

Long-press any widget or app icon (=Wiggle-mode). Now delete iWidgets or drag them around.

* How can I **freely place my app icons** or place them around the iWidgets ?

Use one of this Cydia tweaks: Gridlock, iBlank for iOS 7, HomescreenDesigner or Iconoclasm. I recommend Gridlock, nothing

is easier to use.

* Can I **replace the photo** at the Multi-Widget ?

Yes, just rename any of your pictures to "Photo.png" (even if it's a .jpg-file) and copy it to this path on your device:

/User/Library/iWidgets/Blue's iWidget Multi Photo..../Images/Photo.png. The size doesn't matter, the widget scales it for you.

*Can i use own photos for the **Slideshow** widgets ?

Yes, just name 10 of your pictures to "1.png". "2.png" and so on. Name them ".png" even if it's a ".jpg" file. Just copy your pictures to this path on your device:

/User/Library/iWidgets/Blue's iWidget Slideshow.../Private/Photos/...here... The size doesn't matter, the widget scales it for you.

*Why doesn't my **RSS** widget show **photos** to the news ?

This depends on the source you've chosen, some rss-feeds generally don't provide photos or sometimes show news without photos.

Also the text and photo layout may differ depending on the rss-feed you've chosen.

*Can I add **more sources/feeds** to the RSS-iWidgets ?

Yes, open the **Options.plist** file inside the rss widget folder. Copy the code of one of the sources (e.g: `<key>Yahoo Sports....</string>`)

and paste it below the last source. Now rename "Yahoo Sports" to whatever you like and replace the yahoo rss feed (HTTP://.....<) with

another feed. Next time you can also choose your rss-feed at the iWidget menu 😊

*Can the Instagram Slidehows display my **own instagram photos** ?

Yes, currently it displays photos only based on hashtags.

- Open this website: [SnapWidget | Instagram Widget](#)

- choose "free widget", add your user name at "Customize widget" and press "get widget".

- Now you get your source code, looks like this:

"http://snapwidget.com/in/?
h=**YW1hemluZ3xpbnwxMjV8M3wzfHxub3w1fG5vbmV8b25TdGFydHx5ZXM**=&v=8214"

(Forget the other code there).

- Now open the file **Widget.html** at my **Instagram Widget** and

override ONLY this (red) part of the code with your new code:

//Earth Pics

`inst_a[0] = '<iframe src="http://snapwidget.com/sl/?`

`u=ZWFydGhwaWNzNHV8aW58MTYwfDJ8M3x8bm98NXxub25l" allowTran.....`

- If you want to rename "Earth Pics" do this above the code and also at my file **Options.plist**

- Save your new Instagram widget. Just make a copy and name the Widget "My Instagram iWidget" (otherwise your changes at the original

widget will be overridden with any update)

INSTRUCTIONS for the TWITTER WIDGET:

1. First we must create a **List of Twitter users you want to follow**. You can do this directly on your iDevice. Start your Twitter app, choose a Twitter user you want to follow with the iWidget, e. G. MacCiti and press the **settings icon**:

Now a menu pops up, choose **add/remove to list**:

Now a **menu with your List(s) pops up**. Press on your list to add this user to your list:

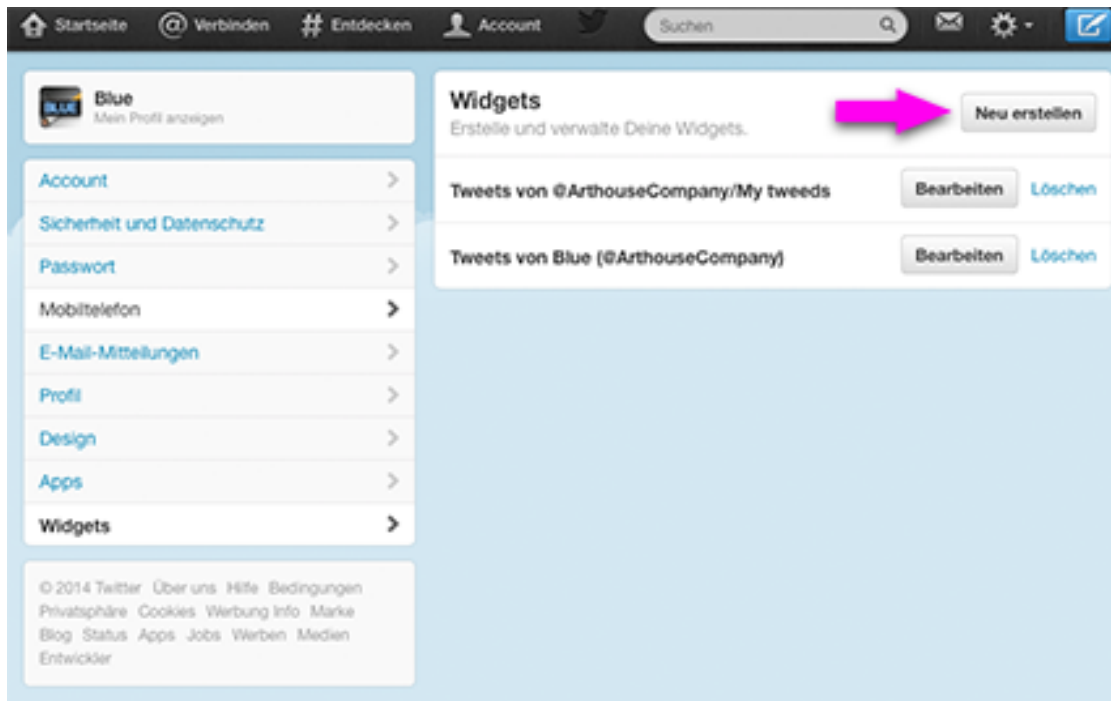

Note: You can later add or remove any user to/from this list directly on your iDevice. The iWidget will always be up to date.

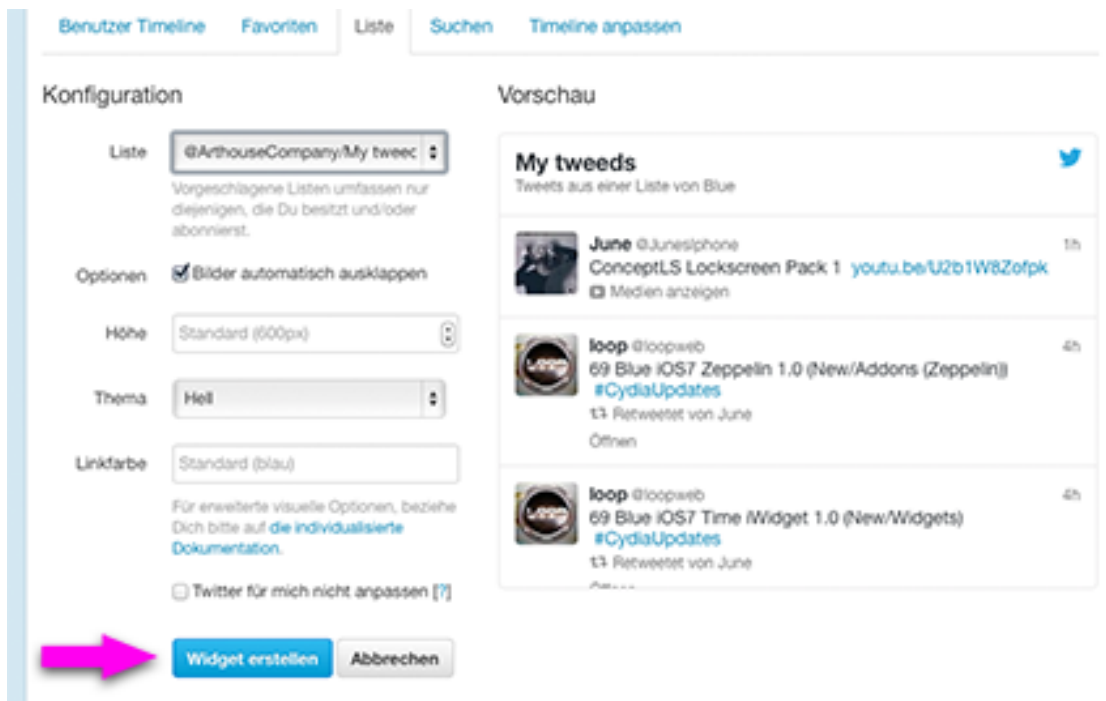

2 Now we need a **Widget ID/Number** for your own **Twitter List**

Open <https://twitter.com/settings/widgets> and log in to your Twitter account.

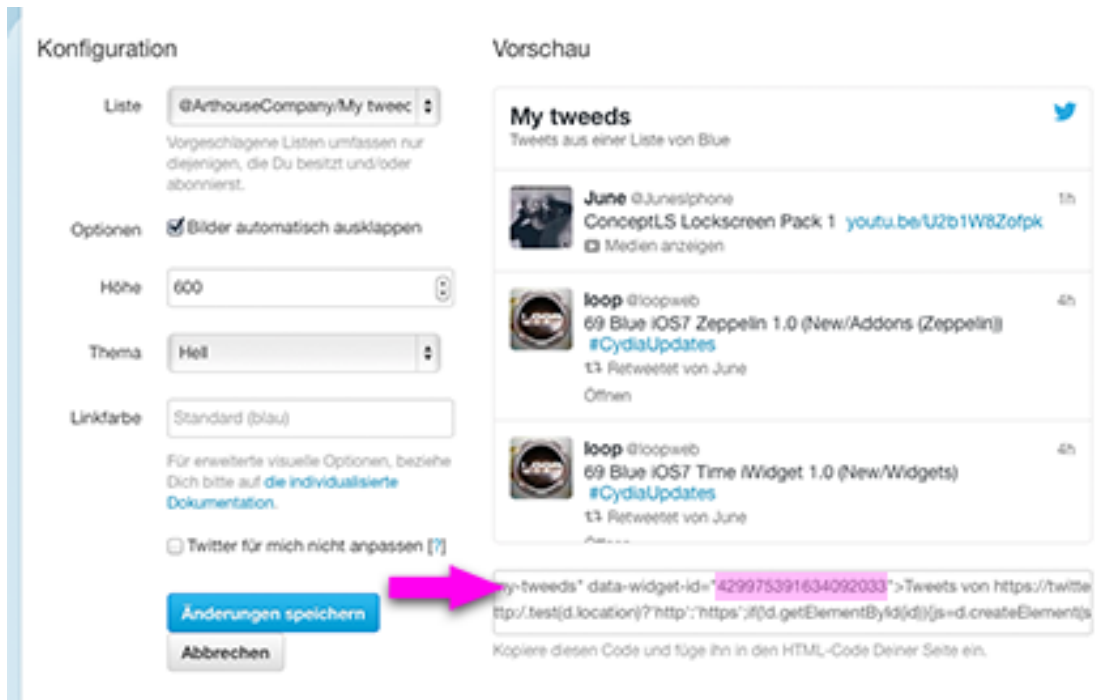

choose: **New Widget**

now choose **create Widget** (forget about all other settings at this website)

Now you see a widget code at bottom right. **Inside is your WidgetID/ Number** that we need for the iWidget.

Copy this number and paste it to the iWidget on your iDevice here:

> User/Library/iWidgets/ Blue's iWidget Twitter.../Widget.html:

That's ist. Make sure you **save this number** somewhere, in case this package will be updated. But you can also **see this number if you open the Twitter Website** (see link above) and choose your Twitter widget from there.
