

# LS Monochrome

---

**Supports:** iOS 4.1.X, iOS 4.2.X

## Instructions to configure LockBackground.html

### ▪ Change to 12/24 HR Format

Search for the following line in the HTML and add the `"/"` as highlighted and shown in red below. Remove the `"/"` to change into 12-hour format.

Line:

```
<!-- Convert hours component of "12" to "24" -->  
//currentHours = ( currentHours > 12 ) ? currentHours - 12 : currentHours;
```

### ▪ Adjusting your weather location

To change the weather go to <http://www.weather.com> and enter your location, then click on the "Find Weather" tab. Next, in the address bar, copy the 8-character code (Example: SNXX0006 = Singapore, Singapore). Open the LockBackground.html file and search for `"var locale"` then paste your weather code in the "XXXXXXX". If you want to change the weather to Fahrenheit, search for `"var isCelsius"` and then change this to `"false"`. Example: `"var isCelsius = true"` will display your temperature in Celsius.

### ▪ Disabling HTML elements

To disable any of the weather elements (temp, description, city and icons) you will need to modify the HTML file in the theme.

SPAN#clock – refers to the time in hours displayed in the HTML.

SPAN#mins – refers to the time in minutes displayed in the HTML.

SPAN#ampm – refers to AP/PM text displayed in the HTML.

#temp – refers to the temperature displayed in Celsius or Fahrenheit.

#weatherIcon – refers to the weather icons displayed in the HTML.

To disable any of these elements add in the line `"display: none;"` under their appropriate Style sections.

Example:

```
#weatherIcon {  
    position: absolute; top: 390px; right: 0px; down: 0px; left: 15px; width: 115px; height: 461px;  
    height: 50px;  
    width: 50px;  
    display: none;
```

### ▪ Adjusting the positions of HTML elements

Adjust the number of pixels where the corresponding HTML element should be displayed respective of either top/bottom/left/right.

Example:

```
<table style="position: absolute; top: 20px; left: 5px; width: 320x; height: 461px; z-index: 14;">  
    <tr align="center" valign="top" border="0" cellpadding="0">  
        <td height="0" valign="top" margin-left="0">  
            <span id="clock">
```

### ▪ Setting your own custom wallpaper

Select your preferred wallpaper and rename it to `"Wall.png"`. Place it into the .theme folder, and overwrite/replace the one already included. Respring the device.

### ▪ For iPhone 3G/3GS users

(If necessary) Replace the OverlayHD.png with the OverlaySD.png file.

Replace the Wall.png with the Wall\_SD.png file.
